Feedback/Analyze

1. Displaying total cases by bubble chart is not easier to compare the data with others.
 - We are going to use BarChart to help to compare other data
2. Would be great to use a Bar Chart as well due to displaying which country is doing great or poorly.
 - We think this is a good idea. However, if we put the Bar Chart with other graphs, a user might be distracted. So we are planning to put a menu that can switch chart kind.
3. Display total deaths somewhere. (in the bubble or the detail tooltip)
 - We are thinking to implement a toggle feature to display the total deaths
4. Since the data we are using updates frequently, it would be a good idea to retrieve it regularly by using the provided API.
 - We confirmed that could get live data from OpenAPI or their endpoint, so we are going to use the live data instead of static data.
5. Choose the bubble size dramatically that helps to compare each data.

- We will choose the size of the bubble carefully so that a user can finger out the data easily
6. When a user opens the web page, the play button should be static and display current data.
- We did not think of playing the play button automatically when a user opens the page, but it would be a good idea to set the play button as static and display current data

Quality of the Feedback

They gave us useful feedback on things we didn't notice. They did really well on their project proposal and shared some tips and info that we could use. Overall, the feedback was useful and helpful.
